RECKLI®

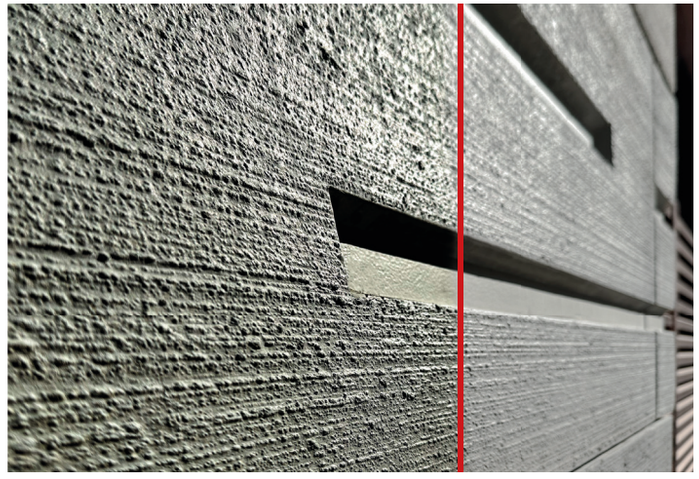
Surface Protection

Defend your concrete against the elements, grime, and graffiti

RECKLI protection systems seal fair-faced concrete surfaces either transparently or with a visual effect. They are suitable for post-treatment of precast concrete façades, in-situ concrete structures, artificial stone, and terrazzo floors.

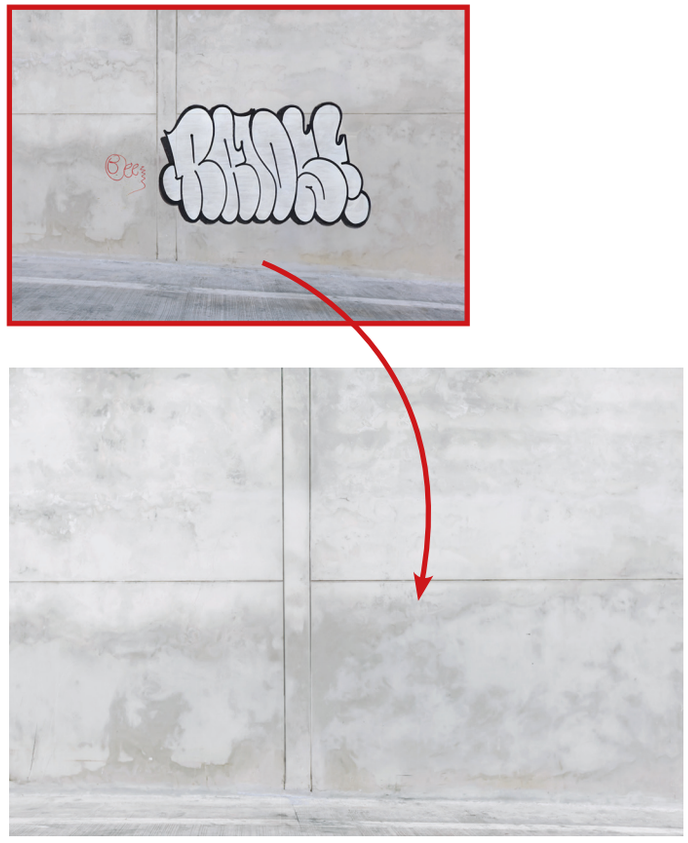
Colorless Impregnations

The RECKLI protection systems **OS-D, OS-HO, and OS-Premium** can be applied to fresh concrete. They penetrate the surface and form a chemical bond with it. Since the impregnations do not create a film, the natural color of the concrete surface remains unchanged.



Effect Impregnations

RECKLI OS-Intensiv and OS-W are particularly suitable for treated and absorbent surfaces such as exposed aggregate concrete, textured concrete, sandblasted, or acid-washed concrete. These protection systems can also be applied to fresh concrete. The materials penetrate the surface and form a film with a matte to silky sheen, which enhances and intensifies the concrete's color.



Graffix

This product combines the protective functions of a colorless impregnation with permanent graffiti protection. **Graffix** preserves the natural color of the concrete surface and can already be applied in the precast plant to fresh concrete. Other materials usually require 28 days of curing. Using the in-house cleaning solution **RECKLI Graffix Cleaner**, graffiti can be washed off without damaging the protective film. This makes façade maintenance particularly easy and cost-efficient. The cleaning process can be repeated up to five times before the surface needs to be re-impregnated.
